

Scottish Sea Farms – UV Disinfection Units

JBD Tritec supplied and installed 2off Ultra Violet disinfection units for a well known fish processor Scottish Sea Farms.

These units replaced existing Hanovia Medium Pressure, multi-lamp units that were showing their age and were experiencing more and more failures.

After a power loss, the Hanovia units required a cooling down period before they could be re-started; The re-starting of the units required to be carried out manually.

The new disinfection units have five lamps per unit, can be re-started immediately (no cooling down period) after an outage, this is done automatically by using the existing diesel generator; so minimal downtime is experienced.
